## GENERAL CARE OF THE MATERIAL: STAINLESS STEEL

GRIFFWERK is not just limited to an attractive outer design – we are proud of our products' inner values too. We exclusively use 304 alloy stainless steel, designated as 1.4301.

The composition of this high-quality stainless steel makes it a corrosion-proof stainless steel with special corrosion resistance and resilience. Corrosion-proof stainless steel forms a very thin protective passive layer that forms again by chemical reactions, even after the surface has been damaged.

## CARE INSTRUCTIONS

GRIFFWERK recommends that you do not use any aggressive, alcohol-based cleaning and scouring agents to clean your furniture cleaning and scouring agents for cleaning.

Please note that the fittings will corrode quickly if they are subjected to exceptional stress, e.g. from building dirt, dust or aggressive vapors and salt water. Steel particles, for example, penetrate the passive layer very quickly and lead to corrosion in the form of so-called „flash rust“. Therefore, clean the fittings immediately after soiling.
